

# Network Security — 15 Final-Year Project Ideas TM471

## Part 1

Eng: Abdelrahman Atif

| No. | Project Idea                             | Description   | Importance  |
|-----|--|---|---|
| 1   | AI-based Intrusion Detection System      | Use ML to detect anomalous network behavior.              | Protects networks from advanced persistent threats. |
| 2   | Cyber Attack Simulator                   | Simulate common attacks for training and testing.         | Improves incident response readiness.               |
| 3   | Data Encryption with Blockchain          | Secure files and integrity using blockchain techniques.   | Ensures tamper-resistance and traceability.         |
| 4   | Email Protection System                  | Detect phishing and malware in email content/attachments. | Reduces social engineering attacks.                 |
| 5   | Adaptive Smart Firewall                  | Dynamic firewall policies learned from traffic.           | Defends against evolving attack patterns.           |
| 6   | Ransomware Detection System              | Identify early ransomware indicators and stop encryption. | Minimizes operational and data loss.                |
| 7   | Password Management Application          | Secure password generation and vault with encryption.     | Prevents credential reuse and theft.                |
| 8   | Network Traffic Analysis with ML         | Analyze flows to identify suspicious patterns.            | Speeds up detection of stealthy intrusions.         |
| 9   | Automated Vulnerability Scanner          | Scan and produce prioritized remediation reports.         | Helps organizations fix weaknesses proactively.     |
| 10  | IoT Security Framework                   | Authenticate and monitor IoT device behavior.             | Secures proliferating connected devices.            |
| 11  | Multi-Factor Authentication System (MFA) | Implement flexible MFA methods and fallback.              | Strongly reduces account takeover risks.            |
| 12  | Cybersecurity Training Simulator         | Interactive labs for security best practices.             | Lowers human-factor-related breaches.               |
| 13  | Wireless Network Monitoring Tool         | Detect rogue APs and anomalous wireless activity.         | Prevents unauthorized wireless access.              |
| 14  | Cloud Data Protection Toolkit            | Tools to encrypt and control cloud-stored data.           | Protects sensitive assets in cloud environments.    |
| 15  | Automated Incident Response System       | Automatically isolate and remediate infected hosts.       | Limits spread and reduces downtime.                 |
